Belintra presents the UBeTrack™: a compact and mobile storage system that saves up to 75% of corridor space and up to 33% of the total footprint of a shelving system

SEMMERZAKE (BE), August 2017 – Optimum and organized use of available storage room gives care institutions a great economic advantage. In 2015, with the self-developed UBeFlex®, Belintra brought out a unique storage system that can be used in both sterile and non-sterile environments. Users can now make even better use of their space with the UBeTrack™ mobile storage system.

The UBeTrack™ builds on the previously developed UBeFlex® so that (with a few extra components) three mobile shelving units can be installed between two stationary shelf units. This option can be used to free up valuable floor space and save on corridor space. To extend it even further, the following range of mobile columns can be attached to one of the previously installed stationary columns, making it possible to build on continuously into the available space.

Hygienic, accessible and easy to assemble

The UBeTrack™ distinguishes itself from other storage systems in a number of ways including the fact that the guide is fitted at the top. This top guide guarantees better hygiene because it leaves the floor surface free for cleaning and the guide system is enclosed to keep it dust free. This also increases user-friendliness, because the vehicles used to transport goods can be driven between the shelves.

Another important feature is the ease with which the whole thing can be assembled. This can be done by one person, which contributes to the financial advantages. The stationary and mobile shelving units can be assembled without the need for any additional tools and the top guide can be secured quickly and easily.

Thanks to the well-thought-out design there is no need to strengthen the back of the shelves. This means that every shelf is accessible from both sides, to further increase flexibility without compromising stability.

Possible combinations

The extensive range of modular set-ups also sets the UBeTrack™ apart. All of the components come in 60 cm depths with shelves in different finishes - massive in plastic or open in chromed steel - and in different widths of up to 120 cm maximum. Columns are also available in the same depth and in widths of 30 or 40 cm to fit plastic trays or Sterisystem™ Perfo-Safe® stainless steel baskets and trays. With these clever options available you can work out how best to fill in your available space. The system is also perfect for storing closed containers.

Identification options

Just like the UBeFlex® storage system, the UBeTrack™ mobile system is only complete once it has been properly labelled. The label holder for the shelves has been designed so that once it has been clicked on to the shelf, no part of it sticks up above the top edge of the shelf, so that goods can be slid off the shelf without touching on anything. When it is set up with baskets or trays in columns, there are also label holders that click neatly on to the posts.

For further identification, PVC color profiles are also available to replace the standard grey profiles so that the storage can be personalized to suit the business or department, or for color-coding purposes to indicate location per discipline for example for storage within the CS/SPD.

Both UBeTrack™ and UBeFlex® are part of a larger Belintra concept for the storage and transport of sterile goods, namely Sterisystem™, the logistic solution to guarantee increased sterility and patient safety.

Following its successful reception at the IAHCSSM conference earlier this year in the US, the UBeTrack™ will be available for viewing by a wider audience in Europe for the first time at the WFHSS congress in Bonn beginning of October. In the meantime, the first installation has started in France through a local distributor.
